

Product Bulletin Zilmet Activflo Signs of Water Hardness

November 1, 2021

Hard water is a common water condition that is a result of calcium and magnesium in the water supply.

Effects of hard water include limescale buildup which can cause a range of issues for the homeowner.

Some signs of water hardness:

White spots on glassware and countertops

Buildup of limescale on fixtures

Water heater makes less hot water because calcium is building up on heating elements and reducing heat transfer efficiency

Water flow has slowed because of calcium buildup in pipes

The Zilmet Activflo is the catalytic water conditioner solution to help prevent and reduce limescale formation.
